

FAX★STAR® Enterprise Solution

The Secure Multi-Platform, Enterprise Solution

IBM Server *Proven™*

The Fax★Star Enterprise Solution contains several components that all together build a solid and powerful Solution. These components are as follows:

Fax★Star Enterprise Server

Installed on a dedicated Windows XP Workstation or Windows 2003 Server, the Enterprise Server offers all the features you ever wanted to have in a communications server. It contains professional fax boards (up to 64 lines). It converts spooled files to fax or email format, and can merge the data with forms, logos, and signatures. *All these functions are performed without utilizing any iSeries or other host resources.*

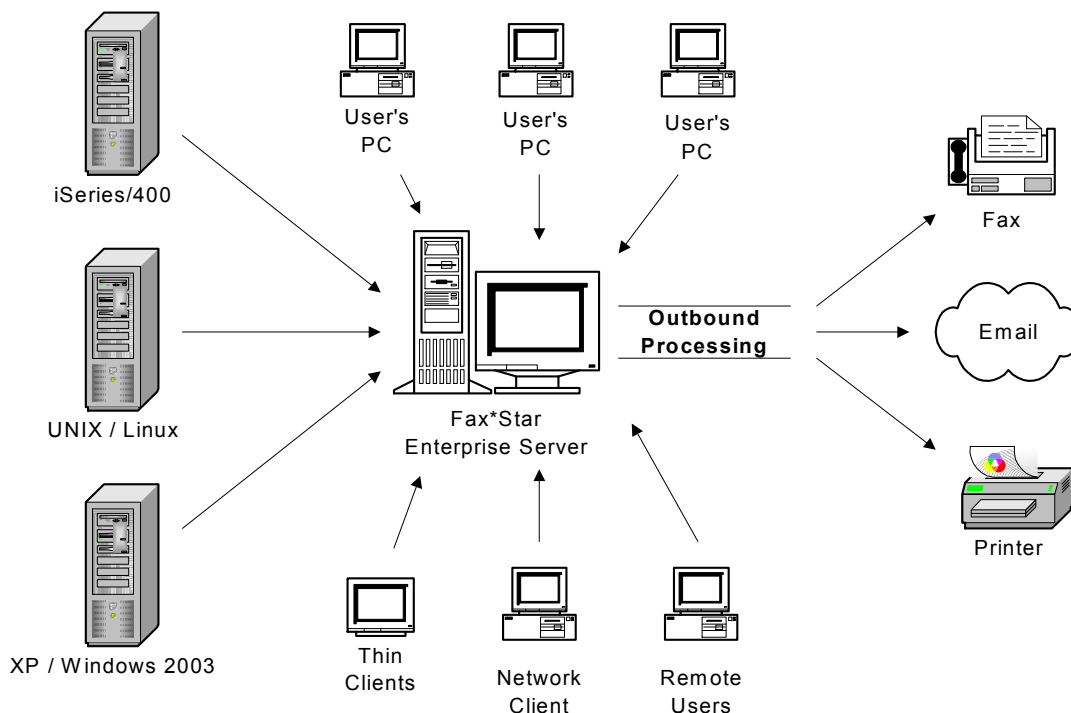

Fax★Star Enterprise Inbound Faxing

Fax★Star Enterprise Server automatically has the ability to receive and distribute inbound faxes. Depending upon the specific installation the Fax★Star Enterprise Server can route by line, CSID, DID, DTMF, or T-30 sub address. The routing information can be stored in the Fax★Star routing table, Active Directory, or within any table on the network that Fax★Star can have access to. Routing information does not need to be duplicated within multiple databases, instead Fax★Star can access the existing database containing the routing information. All faxes can be Emailed, Printed, Saved to a file, sent to a FTP server, or forwarded to another fax number simultaneously. Any inbound fax can be converted to PDF, TIFF G3, TIFF G4, PCX, DCX, or JPEG depending upon where they will need to be stored or sent. All inbound routing can be created either globally or for individual departments or users.

Fax★Star Network Faxing

Fax★Star has additional capabilities for PC Networks and Terminal Server environments. By utilizing the Fax★Star Mail Gateway (Lotus Notes, Microsoft Exchange, SMTP) users can send outbound faxes. Depending on your network, one or more of these tools may apply.

With Fax★Star it has never been easier to fax PC documents.
